Communism Upgraded

How you could have 3 to 6 months of PTO each year

Arkadiusz Stelmaszyk

Introduction

I came to spend much of my free time trying to solve problems and issues. I delivered packages and had 30 to 40 hours each week to keep thinking, recreating and inventing. I spent a good amount of time coming up with ideas for how we can restructure the government to solve some common issues. Some issues that came up were the national debt and poverty. I thought of one idea that would have solved some of our debt and education issues. I thought that education should be free since it makes it more fair for those in poverty and in the middle class to have the options that the wealthy have. With free education, some are set free from having to work in physically demanding or low effort types of jobs, jobs that may keep setting you back in ways you don't care to notice. To solve these issues. I thought we could create income caps. Income caps were designed to make any income over $180k to turn into tax money. So CEO. Doctors, entertainers, and those making money from selling their own homes would have all of their income that is over $180k to be turned into tax money. That's a lot of money and the doctors or doctors to be, wouldn't mind it so much since their entire education was free. Free education makes sense since you're already forced to work, why not have more options of where you work without the options of choices only available to the wealthy.

The next issue I thought about was the national debt. I thought about how we will need to pay it off at some point and that I could start thinking about the ways to do so. With income cap income taxes, it would take much less time to achieve the amount of money we

need to pay off the national debt. I then came to realize that with the money in taxes to pay off the debt, the ones we paid back would need to be able to purchase from the US in the US currency. The 38 trillion isn't just money you give to someone, they have to be able to buy from you. They could buy from other countries who can then end up buying from the US. So there were a few different ways to be able to sell things to those we are indebted to. One idea was that we could sell land, we could literally sell all but the northeast. When selling the land we could include all of the military bases and all that's included. Another option to pay off the debt is to sell labor or create a selling plan. We could provide all the food for a country for x amount of years or make all of their clothing or technologies, as a way to pay off the debt. I then started to think about how if we have robots being able to build anything then those we are indebted to can also do the same thing making most labor obsolete in trade. By this I mean what we are going to be trading is raw materials or raw materials transformed into products and things. That's a lot of raw materials.

After a few months of thinking and creating ideas, I kept psychically hearing someone shouting the words "No money" or "good luck with no money". It started to bother me so I decided to literally give them that, no money, and I started to think about the perks of trying to create a world where we don't use currency. It turns out there are many good reasons to not have money. There's no hand out or bums, there's less ways to buy illegal goods, there's less labor connected to banks and there's no power with having wealth. I ended up thinking and working on my communism plan since it was such a good idea. During these 2 to 3 years, I did not read any works by famous communists or their founding members. My ideas could be considered

original since I did not try to make it from another person's design. The most I knew of communism is what you would find in a 2 minute google search. My main idea of communism is that there's no money in the future and that we all share an equal amount in work.

No debt

With communism I was thinking about how it's going to be one large global monopoly as the only company to work or buy from. When we merge into one there is no debt between countries and within companies. The one company is the entire world and can start making decisions and choices that would be better for the people and the environment. This way of paying off debts is much cleaner and quicker. Without needing to pay someone back with creating products, there's less shipping and less human slavery in a way. Slavery as in, we may need this country to work these many hours to pay back this debt, while another debt free country has citizens that work even less. If we all divide the amount of hours needed evenly, within preglobal communism and national communism, then countries most in debt would have higher work hours needed per week than those not in debt.

With global communism and no debt between nations I also thought it would be fair that citizens themselves were debt free. That isn't the best option since some may choose not to work if they are completely debt free. It's not that we are forcing you to work, it just could mean some sort of chaos and disruption in the current balance of where we are. Instead of removing a person's debt I see a different perk like much larger amounts of PTO for everyone. We can afford this amount of PTO because as the monopoly of the entire world we are bringing in the profits of what current companies currently do, meaning we can also keep paying all the salaries that we currently do. We are giving PTO because the amount of workers and the amount of work gives us some space to allow for the benefit of having longer break times. The same amount of profits + a lower

number of jobs + a system where everyone gets a job =
More PTO for everyone.

3 to 6 months of PTO

When we merge into one company there are lots of jobs that will disappear. Creating ads and marketing will not continue to be around since there's no one else to be buying from. The one company doesn't need you to buy this product over this other product for its own profits. It gets your money no matter what you buy. The company could make it so that they have you buy what products are better for us, our labor goals and the environment. They do not need to have these better for us products in ads because they could selectively choose and make the products that are better.

Other jobs that disappear are jobs in development and product design. Now there aren't 16 different smartphone companies secretly planning and testing the same ideas that they don't know other companies are testing, instead they merged into one and lowered the amount of work being spent on the same things. These companies producing our smartphones can also lower our total labor and waste by having less variety. Currently there might be 200-300 different models where there now are 200-300 different machines being used to allow for the different types to be made. If we lower the number to 20-30 opinions then we can control how much less labor is connected to the manufacturing of the manufacturing plants and less labor in other areas like design and potential recyclability unity with it being all under one brand.

Jobs in transportation and delivery can also disappear. These jobs will be taken over by robots in the future. Jobs in retail and restaurant work can also disappear. Jobs like recruiting can also go away since now there's only one company to work for and it has to give you a job. With these jobs disappearing we are able to shrink down the amount of work others have or

in other words increase everyone's yearly PTO. I looked up some numbers for how many jobs are in those professions. It's like 6 million people in the US in transportation, 1.5 million in delivery and 50 million in retail, 12 million in restaurants and 4 million in marketing. I'm not sure if those numbers are in store workers only but lets imagine they are or that the numbers could be close since I may not have the number for all the other jobs that may vanish. That's something like 73.5 million people could be out of work. There's also 7.5 million people who are unemployed making that total number of extra available workers at 80.5 million. We currently have 160 million employed people or let's say that how many jobs there are. That's 160 - 73.5 to give us 86.5 million available jobs. We then allow the 80.5 million unemployed to chisel away at the amount of work required of the 86.5 million available jobs. Turning those 86.5 million jobs into 167.5 million jobs. If these jobs are all at 40 hours a week then we can afford giving everyone 25 weeks of PTO giving them 27 weeks of work. The number of extra employees to help work the non replaced jobs cuts the amount of work in about half. We can afford to keep paying people the salaries they are currently making while giving them large amounts of PTO.

My initial prediction was that the number was going to be closer to 3 months of PTO each year. My initial prediction was that it would start getting closer to 4 or 5 months when we start to remove jobs from places like entertainment or spiritual and religious jobs. These jobs to be removed won't need to be required at first except for online tarot card readings and other online spiritual jobs. These jobs could be eliminated from the entire one communist company since there's no scientific proof of their beliefs. It lowers the entire work load for everyone

else if they have to get regular jobs just like the rest. These jobs can still exist as volunteer work but we will have to eliminate the ability for them to ask for payments or donations. All donations and charities can also disappear since the main one company would have to cure, aid and help everyone with poverty, homelessness, food shortages.

With online jobs like spiritual jobs disappearing, it also makes sense that we remove the ability to make money from digital goods through royalties. We could have musicians, actors and book writers being forced to be paid salaries. Meaning that all books may be forced to be made by those who are professionally hired by the company to be writers. Fictional books are not essential to living and we can possibly also remove those from being paid jobs. Book writing could be paid for educational and non fiction books only. Everyone else could volunteer their time to write their own fiction novels and have them available for free downloads online.

TV and movies are also not entirely essential work and one day they can be produced by all volunteers. With tv being made by volunteers, there's even more labor adding to how much PTO each person gets.

My most finalized plan is for everyone to move into this one extremely large city designed to house everyone on the planet. Within this city, my plan is that we finally remove the need for money where all jobs are divided into essential and non essential works. This division creates the largest possible amount of PTO that each person will have. Non essential work includes, spiritual, religious, tv, movies, music, video games, other entertainments, even fields like marine biology, astronomy, paleontology. Many of those are not essential to you being able to get up and live your day tomorrow but with large amounts of PTO, possibly 8 -

10 months per year, means that we would have plenty of time to study and volunteer in non essential fields. Another option for non essential entertainments is that you have to work in a non essential field to have access to the non essential entertainments.

A design for PTO could be that we each get to pick our off season. If PTO becomes 3 months then we could have something that looks like 4 doctors in this building. Each doctor gets to pick one of the 4 seasons for their PTO. THis means we will always have 3 doctors on staff year round. THis plan also makes it easier for managers now that scheduling doesn't need to work around someone's vacation days. If PTO is 6 months we could have a doctor choose to work spring/summer, summer/fall, fall/winter, winter/spring or we there's only 2 options spring/summer or fall/winter. There may be a time that a doctor wants to have their summers off but that option isn't available at their building. With good performance scores, and no work rules violated, you could ask to have your off season changed. You have to wait on a wait list and until the other doctors don't perform as well. Maybe you volunteered with some unpaid working hours which could erase some of your negative working performance score. You could also see if you could transfer to another building that does have your preferred PTO season. Your work performance score can also be the score that you have outside of work as a citizen. Like whether you jaywalked, sped while driving or got in a fight with a stranger. Your work performance score merged with your citizen reputation score makes you more likely to want to do good so that you can have a first choice of your PTO season. I also have thought of how we can arrange these into one central idea called the Life score. The Life score is an

optional design for what we can do with communism. With communism, it could be easier to watch what everyone says and does with one central monitoring system. Everything you text, say on a phone call, do on your computer or purchase can be watched and given a score for how bad or good it is. There's more to this that I can describe in a later chapter where the score can be simply a labor score of how much labor your purchases cost the rest of the human race. My main idea was that we could be given good vs bad scores where if we went to jail or used recreational drugs that our scores would decline. The idea was that we all get free retirement where we retire with those who had similar scores as us, letting the healthy non rule breakers retire among themselves.

No ads

One of the immediate perks of global communism will be that there will literally be no ads. There's no other company to buy from and there's no need for them. The internet will be cleaner and higher quality. We will even be saving ourselves small but calculatable amounts of energy without ads taking up the extra megabits of data to reach your smartphone. The energy is saved in the following areas: the computers used to calculate where ads go, the servers used to store ads, and the energy used to send mbs for ads through home and cellular internet. In short your smartphone will gain minusculely longer battery lives without advertisements. The internet also cleans up without competition companies needing to write reviews for products. Sometimes companies write reviews not to be informative but to use it as a marketing tool to get more attention for their product. There's also less lying about the quality of products. I have had purchases from amazon where they would ask me to make five star reviews in exchange for a $50 coupon. I haven't done so but these practices will disappear when we don't need to lie to make sure our products look good.

We will also see that we don't have to try to leave out certain important details about our products in our websites. All products for purchase can grow to be very truthful and honest allowing for what the best choices are to survive and be decided on. We also now will be able to tear down billboards and not have to create the materials needed to display ads. There are even ads displayed on large displays that can disappear, saving us energy, power and labor.

Sometimes ads are needed for music and books. If you're a self-published author and have no initial

recognition, it would be harder for you to make any money without trying to advertise your books first. My plan is that we should do what I suggested earlier and have an author for hire to write nonfiction and educational books only. All other non-hired authors would have to write without pay. We could have all non-hired authors selling their books for free where making them more popular can be done with new ways to identify and display new books all without ads. Content like video games could also be created by hired video game developers only. All private game developers could be allowed to create games and sell them for free. Without royalties, salaries and wages are more easily controlled. If someone makes 2 million dollars off a single, then they don't have to go back to work anymore since they have enough money to sustain themselves. With more people being able to afford not going to work, the lower your yearly PTO is. Without royalties video game developers could be professionally hired and paid a consistent salary making things more and giving everyone else large PTO amounts. The same idea goes towards making Youtube videos, movies, music and writing books. Youtube can transform into unpaid video uploads after the communist transition. The more people there are in wealth, the more those in poverty have to work since those in wealth don't have to contribute to the global labor needs. The end goal of my communism plan is that without money we all plan on working equal amounts of hours per year with making it so that everyone has to work creating the greatest amount of PTO per person while making life more fair for everyone else. Making us all equal, creating a heaven on earth.

One last note about ads is that when we merge into one, we will not need to have any advertising in our mail. This lowers our trash levels, labor and pollution

connected to junkmail. Plus the post office employees have slightly less work to do.

Stocks and Cryptocurrency

When we all merge into one the values of stocks and cryptocurrencies can be frozen. That frozen value is then the value that we can pay you for your stock quantities. People have bought stocks and have 401k plans so this makes it a bit more pleasant at the merge, or at least gives us a direction of what we should do. The money created for paying you for your stocks was created from nowhere, meaning we added 3 trillion to the circulation to pay you. That money added to the circulation then is planned to be recollected slowly through taxes and regular purchases. All profits from purchases merge into the one company where some taxes can disappear as well since the company is bringing in profits where the profits can pay for what the taxes once did. Inflation can be controlled and made to not exist since the entire company can freeze the prices and values of things, so the additional 3 trillion shouldn't inflate anything. Normally adding more money into circulation would be what causes inflation, since there's more money laying around and to keep the balance, prices go up.

Cryptocurrencies I believe may have caused some of our inflation of today by adding more money into the world's currency circulation. Cryptocurrency values will also be paid to you at the communism merge. Cryptocurrencies then can be turned illegal and unable to spend with. Cryptocurrencies are not what is best for the planet since they require mining parts to be created and there's lots of electricity needed behind cryptocurrencies. It's an evil when there's no money around because all it does is create waste and pollution on something imaginary.

When the global communism merge happens, all other currencies can also be turned into one for their

current value as if frozen in time. This should work without any issues. When all currencies merge into one we can also create a single bank, lowering the amount of labor needed behind needing to maintain different banks to access. We can also make all currencies digital and eliminate all credit card purchase fees. In other words, we can now pay rent or buy cars without credit card fees. To give an additional perk of communism, we can allow for 0 percent loans on first homes bought under 600 sq ft or first very green car purchase. This will solve some issues that people in poverty may have while making our better planet options as the ones with a discount. 600 sq ft homes would cost us less in building parts and labor while also using less energy than other larger homes. People in developing countries would also be given the same options making it easier for them to have more updated and healthier homes.

Taxes

With global communism being able to take all profits into one, we have less of a need for taxes. Salaries can also be created to be what they appear as if post tax. Lowering the number of taxes we need to pay can simplify and create less work for people, tax companies and the government. My main idea with taxes is that we can literally remove all but one, property taxes. The reason why I want to keep property taxes is so that we can build one large state sized super city to house the entire planet's population. Property taxes take us there by increasing the same amount yearly. We want everyone to have to some day move to the large city because there will be less energy and labor connected to global transportation and shipping. My idea is that we have property rise 0.5 to 1 percent each year. With property taxes rising it takes 100 years for a half a million dollar home to cost you 250,000 in additional taxes. Doing this means that the current generation could still be able to live outside of the super city but the next generation or the one after, may be forced to move due to not being able to afford the tax. This idea would also affect the extremely wealthy, but they would be able to try to live outside of the city as long as possible, making it possible to take over a thousand years with lower value homes. There's a good chance that they try to move into the city since there's more people and more happening over there. My plan for this city is that you have to hand over all of your money and possessions to be able to move in. Once moved in, there's no money and your PTO is maximized with the city's design. Inside the city we also plan on having the highest end technologies that we made inaccessible to those living on the outside, giving it another desirability.

Super City

The super city is a place where we all will one day want to live. Everything is free and there is no money. We have limits on how much you can have but everything is basically recyclable and upgradable. We couldn't ask for 7 smartphones where we know we only need one. Not being able to buy 7 of them lowers the amount of work and labor connected to you. The goal for the city is to have labor at its absolute lowest, or with the highest amount of PTO per person. Some of my ideas to lower labor are connected to food. If food is always made for you then there's less labor and waste connected to packaging or food going to waste. My main idea is that food can always be reheated like a frozen or refrigerated meal. We could have the meals created in glass or reusable plastic containers. All of your meals could be made to your design, or you can basically pick whatever you want to eat. Diets can also be more closely controlled by trying to eliminate high salt, high sugar and high fat. Without the competition of capitalism, companies wouldn't need to make something more sugary or salty to make sure people are addicted. Having our meals pre-made lowers the waste and trash currently connected to the packaging of grocery foods today. Each person can have 20 of their own containers with their names on them that get rewashed and reused just for them. Without the ability for a person to cook their own food, we also lower the amount of labor connected to the kitchen industry. We don't need to make ovens, cutting boards, cooking utensils and more. Without the kitchen we can also remove the knife. Without the knife, there's less of a chance that someone stabs another. All food can be delivered to your home by robots. There's also the

option to go out to eat in restaurants. Restaurants give other options like the occasional fried food or sandwich. These restaurants could be created and operated by robots where we might send less pre-made food to your door interchange for each meal you ate at the restaurant. Healthier diets would also lower the amount of labor people need when going to the doctors. What I mean is that there's less work for a doctor to do if we make everything and everyone healthy, making it so that we need less doctors in the future.

Within the super city I plan on having cameras inside and out. Cameras everywhere would make the world safer without people wanting to or thinking of committing any crimes. With every living place basically an apartment, it would be easier to have them built with cameras in every room. Cameras can also be installed in bathrooms so that there's no blind spots for illegal activities or unseen domestic abuse. The cameras can be designed to have blurring built into them. If you enter a bathroom, the camera can instantly blur you and your body. If the camera detects that you committed a crime, it sends the video to the police department. The police then can look at the footage but the footage is blurred if you were in the bathroom. You would still need to watch the footage to try to verify what the illegal action was. Any objects your hold can remain unblurried. The main idea is that you're blurry and that someone trying to access you on camera can't see past the blur. Live camera footage can't be watched of you unless approved by a superior officer for something like say a murder happened and they were trying to escape. Having sex in your bedroom would also be on camera but you are blurred and the footage isn't seen by anyone unless a crime was detected.

The super city would have free transportation. It doesn't make sense that we have our own cars anymore.

Individual cars would require more energy and labor than a city wide train and subway system. Trains also have no tire pollution compared to cars. The best option for trains and subways is that they are mag lev. Mag lev means that there are no break pads and parts to replace in that area. I have personally done some work into improving the energy costs of trains and cars. Trains can have lift giving rooftops that lower the train's weight. A train or subway can reach a selected top speed, like 45 or 100 mph. When the train reaches the top speed it can weigh none or next to none because of how much lift force is given through its lift roof(s). One example of lift roofs is this 3 roofed train I calculated. At 70 mph it had 13,000 lbs of weight removed due to lift. The total drag increased from 1,000 to 4,000 but the amount of weight reduced is worth the amount of drag added, still reducing the energy used. This lift train was a 21 ft model and it was 30 ft tall with 3 roofs. If we have less roofs we have higher speed limits. The roofs were designed to have the same surface area as the footprint of the train segment. Shorter trains mean lower weights meaning less roofs to create desired results. These lift roof trains also need to be wind resistant, meaning that they are in wind proof tunnels. Tunnels can be glass or plastic see through tunnels that allow us to watch the outside as we ride. Another solution to removing wind effects on these trains is that we have the entire city under a dome. A glass or plastic roof with bug screen walls reducing and eliminating any wind effects.

   My most basic and easiest design for this city is that it is one large square or rectangle. The roof is a pent roof collecting rain on one side. Each tile of glass or plastic can be exactly the same making it easier to have more for replacement. The roofs can also have rail

systems to have robots that can repair and replace the roof sections for us. The roof can also be designed to be uv blocking if we are concerned with that. We can also have the option to have the roof be 5 to 10 percent tinted as white. With a white tint, the roof would be brighter at night time making it possible to see more outdoors at night.

The domed super city could also have a single solid foundation. A solid foundation means that there's less repairs needed for things like streets and sidewalks. A solid foundation also means that with the bug screen wall and roof we could have no pest or animal problems. No pest control means less labor, less health concerns and less harm to animals caused by humans. There's also no road kill and no need to clean bird waste on the city streets. The solid foundation may be tricky, I'm no engineer, but it would need to support lots of weight and not sink into the earth over time.

All of the transportation could be underground. We can even remove the ownership of bikes, scooters and skateboards. Without these, there's less accidents and broken bones. Less work related to doctor visits caused by injury, less labor related to making sure everyone has a bike, and more peaceful walks to those who rather not have a biker ride into them on the sidewalks. This is something that would be preferred by the elderly. Without bikes we also have less tire pollution or skid marks on the sidewalks, making the streets easier to keep clean.

We could have all the emergency vehicles underground as well where each apartment building has access to the underground public transportation, robot delivery level and emergency services. Emergency service could have more rapid timing without anyone else on the roads when on their way to the apartment building.

The super city can be designed to be entirely white inside and out. If we have our interiors and exteriors in all white we might be able to evolve and develop white hair. Polar bears and arctic animals are constantly surrounded by snow so we may be able to evolve and have white hair naturally and without it being albinism. All white outdoors and indoors means that we also need less power to see at night. The streets could feel well lit at night just like how it's easier to see outside at night in the snow. Indoor energy use can also be slightly lower with all white interior walls using less power to appear brighter.

With bug screen walls and pest control, we could have it so that everyone needs to wash their clothes and shower each time they come back from the exterior world. This could prevent any small insects from coming into the city. Through the city, we could even have no soil allowed. Soil and plants could lead to accidental insect infestations. We could have all farming done hydroponically or within areas outside of the domed city, having the farmers need to shower before they come back inside.

My idea for housing is that within the super city we all have 1,500 sq ft. If you're single, married or with kids you have only one housing option. This makes it easier and allows for simplicity in equalness. With 1,500 sq ft houses I calculated that the area of the city would need to be the size of 20 New York's for the population size of 1- 2 billion people. We could have people having child limits of 1 child per couple with more child amount options for controlling the future humans hair color. The size of the city streets would also be narrower than New York's since there's no cars or traffic on the surface with the surface being walk only.

Within the city we can also plan for everything to be 100 percent recyclable, no trash whatsoever. We could have a smartphone cycling through every 4 or 5 years with options like free repairs. People could vote on the types of designs or styles that are to come. Then when the designs are finalized we can all preorder the phone we want, giving us a n exact number of how many devices to make rather than making a surplus. We could have some extras just in case but this increases our total PTO when we lower our total energy and work load.

Essential vs Non-Essential Work

Within the super city or even outside of it, we would want to have essential and non essential work separated. Like mentioned previously, separating the two would mean that we would each have less work needed to be accomplished and would have the largest PTO amount. Non-essential work included spirituality, religion, entertainment, astronomy, space exploration, biology, anthropology, video game development and more. Jobs and education in all of those fields could be considered volunteer work. With all of those as volunteer work, there's more people working on the essentials, increasing our PTO. Non-essential workers could be given perks like access to non essential entertainments or the right to have their name going down in history as those who volunteered. Jobs in religion are also considered volunteer and priests would be unable to make money through donations since there is no money. Priest and religious followers can still have places of worship within the super city. Without money for religion, there's a possibility that it may not survive since fewer people are choosing to be priests as a source of income. A natural survival of the fittest with what is truly essential. TV and movies can also disappear if people decide to not volunteer for their creation. The creation of tv and movies is also possible due to the communist company having to provide the camera equipment, space and tools to learn how to make tv shows.

Essential work would include jobs like repair, electricians, manufacturing, power, food, clothing, water, education, internet, communications, physical recreation, upkeep of non essential workspaces and

equipment. Having everyone need to have an essential job would increase our total yearly PTO to possibly 10 or 11 months per year. Imagine that, working 1 to 2 months per year. There's no money within the super city so PTO translated to having to work 1 to 2 months per year. During your off time you would have time to go to school for non essential work. You could choose to write books, create video games, choose a wildlife studies degree so that you can go outside to observe wildlife.

My idea for education is that we could lower the amount of time we spend in college. College could be required where the degrees available are for the essential jobs. Acceptance into an essential job degree/training can be based on test results and performance. It can be similar to pickling jobs in the military where they might pick those with the highest score before the ones with the lower scores. College wouldn't need pre req courses or electives. High school can also be slimmed down with less electives and maybe without the senior year. All college degrees or training could be completed within 1 to 2 years for each and every essential job. Jobs like being a doctor would need to be more specialized and shrunken down in its knowledge level. Jobs like surgery could be made unavailable due to how much more schooling is required. Without many diseases or accidents, the need for surgery goes down and we may never need surgeons at all.

Sometimes we may need some to select jobs in fields that aren't very popular, to make this easier, we could allow those who decided on waste management to have the rights of someone who volunteered for non essential work. Non essential workers are given non essential entertainments to enjoy where when labor in waste management was needed now we have people who are

able to have access to non essential entertainments. Those who do essential work only and without non essential contributions could still enjoy the occasional movie, video game or concert. They are all free but limited when you don't contribute any. We could even include rare vacations to those who decide to work in an in demand vocation.

If you didn't land your desired essential job, you can go to school for that essential job on your off time. You can retake the tests and get accepted based on the next year's labor needs. If others are choosing to switch jobs and training then the spots become available.

Good Vs Evil

Before the super city merge we can have a good vs evil scoring system. The life points of how much labor you cost each other, whether you committed a crime, if you come to work late or if you take drugs or alcohol. With your electronics being able to be watched at all times we can watch how you interact with others and watch what you purchase. If you decide to be mean to someone over the internet or through texts, the system can catch that and add some negative points onto you. This points system is so that we are able to retire with those who scored similarly to us. Each year there's a new wave of eligible retirees and the population of 100,000 people can be evenly divided between 100 retirement homes based on their scores. Retirement can be free for everyone and can have everything you need. With communism, there are no other retirement options besides this or staying in your home. With everyone divided we can not have ex criminals retiring together, meat eaters retiring together, and those who decide to cost us the least amount of harm and labor retiring together.

My idea is that eating meat and drinking alcohol harms us and others. Animals were harmed in having to be caged and then killed so that you can enjoy your burger. Alcohol harms your body, harms others in how you behave, and causes damage to your body which increases the amount of work a doctor may need to do for you in the future. Alcohol can also leave you with unhappiness which could be what you share with others, harming us all. Certain products purchased may create more pollution than others or cost us more human labor so they have points that add onto your score. Your score can be improved by choosing to volunteer where needed. Everything you purchase

would have a points score connected to it since it costs us labor, energy, pollution or harm to another. Every gallon of gas for instance adds to your score making some want to not drive or spend money so that they are in retirement with those of better scores. This idea makes it so that if you're wealthy or unwealthy you're surrounded by those just like you. SOme wealthy people may choose to overspend money where too much spending might lead them to retirement with those who were once in jail. If you commit crimes they increase a larger amount onto your life score. This idea could create a system where we naturally grow towards doing good and making the better choices or we can have the entire communist machine decide all the best options for us.

Here's an example of my points scoring:

Pollution score + labor score + energy score(energies sources pollution and labor score) ethical score = life score points

Example: A smartphone

(Pollution score) Individual parts produce x amount of air pollution due to fumes + recyclability rating

Rough score of 7

(Labor score) Each phone needs x amount of laborers to put the phone together + x amount of labor for the raw materials

Rough score of 3

(Energy score) Each phone demands x amount of kwh, each kwh is rated at the score behind where the energy is sources + how many laborers are needed behind repair and maintenance of the energy + labor behind fuel unless it's natural resources

Rough score 2

(Ethical score) How good or bad the purchase is for you or society. Are living beings being harmed?

Rough score possibly 0

This smartphone example puts 12 points on your life score.

Hair Color

I have done some of my own thinking about our future human hair color. If we all merge into one country then through natural breeding we would have black hair. 80 or so percent of the world has black hair. I believe that we should choose to breed to try to lighten our human hair color to something of a medium or light shade. We could have blondes be given the ability to have 4 or more kids, medium haired people to have 2 kids and dark brown and black hair to be limited to 1 child. We do this over and over until our human population reaches 1 to 2 billion with at least 50 percent of the population being blonde for our super city.

It may be that black hair means something more negative for us. I have been watching and hanging out with crows. I noticed that they do not seem to display or share the most amount of happiness compared to other animals. I have seen hawks and eagles look at me but they looked as if they were smiling largely. Another observation about the crow is that it does hang around or poke at dead animals. Vultures have dark brown hair but they also eat the dead.

We have also as a race identified black hair as the colors for villains in movies, books and tv shows. We also had ideas for how witches wore all black. The word black was also used to define evil in the word black magic. Black magic is bad magic or magic that causes harm. There might be a literal connection to the color black and to if they do indeed naturally cause more harm than good. Like being more selfish or mean to others. Even dark jokes or jokes that poke at others would be considered bad. Doing to others what you wouldn't want to have done to yourself would be considered bad or harmful.

Having light hair instead of dark or black hair could also be better for the future race or for future alien species we encounter. If black hair does indeed mean that we do more harm then we could run into less problems in outer space when having lighter shades of hair. We could even try to partner up and follow some path of being with those of lighter or white shades.

Another observation in nature on the color black is the ant ant the termite. The termite is a light color while the ant is black. The termite is a vegan that eats dead wood while the ant may kill and fight anything it comes across. The termite also has mandibles that are darker in shade than the rest of its body. The darker shade could be like having darker hair. The termite does eat only wood but its history may have been darker, just like the ants, killing and fighting other insects before it became vegan. The termite king is darker in color and maybe it's more aggressive or more of a bully on the inside.

Other observations on the color black are in humans. Hitler had black hair and caused harm onto jewish people and others who fought in the war. He also partnered with the Japanese who also had black hair. The Japanese then kamikazed us, an act of war that was dark in how it harmed their own. Other observations on the color black are how those in other countries have done some actions that could not be wise. I once watched a video online where these african men handed a machine gun to a chimpanzee who then started shooting around. There may also be more scams from overseas that may be from Asia or Africa. I do not see many of them coming from Europe.

My belief is that we would be better off if we breed so that the human hair color of the future is a medium or light shade. We could have it so that everyone's DNA makes it onto the future human race. So by breeding one child per black haired individual their population

shrinks while we increase the population of the lighter shades. A black haired individual's great great great great grandson would have light hair just like everyone else and their genes carried on.
